(54) Title: PROCESS FOR THE PREPARATION OF AN ETHYLENE AND α -OLEFIN COPOLYMER (57) Abstract <p>The present process preparing an ethylene/α-olefin copolymer is conducted in the presence of a novel transition metal complex and co-catalyst. The process is further characterizable in that the transition metal complex is a reduced transition metal complex, selectable from groups 4-6 of the Periodic System of the Elements, with a multidentate monoanionic ligand and with two monoanionic ligands, at a temperature of between 100 and 220 °C. In particular the reduced transition metal in the complex is titanium (Ti (III)).</p>

5 PROCESS FOR THE PREPARATION OF AN
 ETHYLENE AND α -OLEFIN COPOLYMER

BACKGROUND OF THE INVENTION

1. FIELD OF THE INVENTION

10 The invention relates to a process for the
 preparation of an ethylene and α -olefin copolymer with
 an ethylene content of between about 20 and 90 weight %
 at a temperature range of 100-220°C, with a catalyst
15 composition comprising a transition metal complex and a
 co-catalyst.

2. DESCRIPTION OF THE RELATED ART

 A process for the preparation of an
 ethylene/ α -olefin copolymer is known from U.S. Patent
20 No. 5,491,207, in which a cyclopentadiene based
 transition metal complex (in combination with a co-
 catalyst) is used to prepare ethylene/ α -olefin
 copolymers having an ethylene content in the range of
 about 20-90 mol%. Here and hereinafter the term
25 "copolymer" means a polymer formed from two types of
 monomeric constituents: ethylene and one or more α -
 olefins.

 A disadvantage of a process according to U.S.
 Patent No. 5,491,207 is that it is conducted at
30 relatively low temperatures (-10°C to about 100°C),
 which cause the process to be less attractive from an
 economical point of view. There is a need for a process
 to be conducted at higher temperatures. There is also a
 need for a higher temperature polymerization-process
35 which does not require too high a pressure, otherwise
 the costs for such a high pressure process could undo
 the advantages of a high temperature process.

SUMMARY OF THE INVENTION

It is therefore, an object of the present invention to solve the aforementioned problems associated with the related art as well as to address the need expressed above. In accordance with the principles of the present invention, this object is obtained by providing a process for the preparation of an ethylene/ α -olefin copolymer with an ethylene content of between about 20 and 90 weight %, at higher temperatures that range from 100°C to 220°C, with a catalyst composition comprising a transition metal complex and a co-catalyst.

Another object of the present invention is the provision of an ethylene/ α -olefin copolymer obtained by the means of a polymerization process with utilization of the catalyst composition according to the invention.

In the present process, the polymerization of ethylene and at least one [additional] α -olefin is conducted under effective copolymerization conditions at a temperature of between 100°C and 220°C, under the influence of the present catalyst composition.

The catalyst composition includes at least one complex comprising a reduced valency transition metal (M) selected from groups 4-6 of the Periodic Table of Elements, a multidentate monoanionic ligand (X), two monoanionic ligands (L), and, optionally, additional ligands (X). More specifically, the complex of the catalyst composition of the present invention represented by the following formula (I):

wherein the symbols have the following meanings:

- M a reduced transition metal selected from group 4, 5 or 6 of the Periodic Table of Elements;
- X a multidentate monoanionic ligand represented by the formula: $(Ar-R_t-)_n Y(-R_t-DR'_n)_q$;
- 5 Y a cyclopentadienyl, amido ($-NR'-$), or phosphido group ($-PR'-$), which is bonded to the reduced transition metal M;
- R at least one member selected from the group
- 10 consisting of (i) a connecting group between the Y group and the DR'_n group and (ii) a connecting group between the Y group and the Ar group, wherein when the ligand X contains more than one R group, the R groups can be identical to or
- 15 different from each other;
- D an electron-donating hetero atom selected from group 15 or 16 of the Periodic Table of Elements;
- R' a substituent selected from the group consisting of a hydrogen, hydrocarbon radical and hetero
- 20 atom-containing moiety, except that R' cannot be hydrogen when R' is directly bonded to the electron-donating hetero atom D, wherein when the multidentate monoanionic ligand X contains more than one substituent R', the substituents R' can
- 25 be identical or different from each other;
- Ar an electron-donating aryl group;
- L a monoanionic ligand bonded to the reduced transition metal M, wherein the monoanionic ligand L is not a ligand comprising a cyclopentadienyl,
- 30 amido ($-NR'-$), or phosphido ($-PR'-$) group, and wherein the monoanionic ligands L can be identical or different from each other;
- K a neutral or anionic ligand bonded to the reduced transition metal M, wherein when the transition
- 35 metal complex contains more than one ligand K, the ligands K can be identical or different from each

other;

- m is the number of K ligands, wherein when the K ligand is an anionic ligand m is 0 for M^{3+} , m is 1 for M^{4+} , and m is 2 for M^{5+} , and when K is a neutral ligand m increases by one for each neutral K ligand;
- n the number of the R' groups bonded to the electron-donating hetero atom D, wherein when D is selected from group 15 of the Periodic Table of Elements n is 2, and when D is selected from group 16 of the Periodic Table of Elements n is 1;
- q,s q and s are the number of $(-R_t-DR'_n)$ groups and $(Ar-R_t-)$ groups bonded to group Y, respectively, wherein $q + s$ is an integer not less than 1; and
- t the number of R groups connecting each of (i) the Y and Ar groups and (ii) the Y and DR'_n groups, wherein t is selected independently as 0 or 1.

It has surprisingly been found that a transition metal complex of formula (I) makes it possible to prepare ethylene/ α -olefin copolymers at temperatures between 100°C and 220°C, whereas other known catalysts for these types of polymerization do not produce copolymers at temperatures above 100°C (they are only active at temperatures well below 100°C; U.S. Patent No. 5,491,207 discloses temperatures between -10°C and 100°C and shows examples with temperatures between 35°C and 50°C).

The process according to the present invention is suitable for the preparation of copolymers having an M_n (the number-average molecular weight (as determined by SEC-DV (Size-Exclusion Chromatography/Differential Viscometry combination))), of as low as about 100. The temperature at which the polymerization is performed is one of the parameters to control the value of M_n . In principle, any ethylene/ α -olefin copolymer can be made with an M_n between about

100 and about 500,000.

Copolymers with a molecular weight M_n between about 100 and about 30,000 are preferably prepared in a polymerization process at temperatures
5 between about 135 and about 220°C; copolymers with a molecular weight M_n between about 20,000 and about 100,000 are preferably prepared in a polymerization process at a temperature between about 115 and about 180°C.

10 The copolymers also have an ethylene content of between about 20 and about 90 weight %. The copolymers can be amorphous, being products with an ethylene content of between about 30 and about 70 weight %, or can be semicrystalline, being products
15 with an ethylene content of between about 70 and about 90 wt %.

The pressure at which the polymerization is conducted is preferably below about 100 MPa. Pressures up to 10 MPa are in several cases sufficient enough for
20 a good catalytic activity. CA-A-2,11,057 discloses a process (in comparative experiment 2) for the preparation of an ethylene/butene low molecular weight copolymer at an extreme high pressure of 1,330 bar to cope with the extreme low catalytic activity at normal
25 pressures.

Other processes known in the art to produce low molecular weight ethylene copolymers either start from high molecular weight products which are broken down in molecular weight (e.g. by shearing) or by
30 using, during the polymerization, an extreme amount of chain regulators (~~e.g. hydrogen or diethylzinc~~) for keeping low the molecular weight. In all cases, the temperature at which the copolymers are prepared is as low as -10 - 100°C.

35 The foregoing and other objects, features, and advantages of the present invention will become

apparent from the following detailed description and claims.

BRIEF DESCRIPTION OF THE DRAWINGS

5 The accompanying drawings illustrate the present invention. In such drawings:

 FIG. 1 is a schematic view of a cationic active site of a trivalent catalyst complex in accordance with an embodiment of the present invention;

10 and

 FIG. 2 is a schematic view of a neutral active site of a trivalent catalyst complex of a dianionic ligand of a conventional catalyst complex according to WO-A-93/19104.

15

DESCRIPTION OF THE PREFERRED EMBODIMENTS

 Various components (groups) of the transition metal complex are discussed below in more detail.

20 (a) The Transition Metal (M)

 The transition metal in the complex is selected from groups 4-6 of the Periodic Table of Elements. As referred to herein, all references to the Periodic Table of Elements mean the version set forth
25 in the new IUPAC notation found on the inside of the cover of the Handbook of Chemistry and Physics, 70th edition, 1989/1990, the complete disclosure of which is incorporated herein by reference. More preferably, the transition metal is selected from group 4 of the
30 Periodic Table of Elements, and most preferably is titanium (Ti).

 The transition metal is present in reduced form in the complex, which means that the transition metal is in a reduced oxidation state. As referred to
35 herein, "reduced oxidation state" means an oxidation state which is greater than zero but lower than the

highest possible oxidation state of the metal (for example, the reduced oxidation state is at most M^{3+} for a transition metal of group 4, at most M^{4+} for a transition metal of group 5 and at most M^{5+} for a transition metal of group 6).

(b) The X Ligand

The X ligand is a multidentate monoanionic ligand represented by the formula: $(Ar-R_t-), Y(-R_t-DR'_n)_q$.

10

As referred to herein, a multidentate monoanionic ligand is bonded with a covalent bond to the reduced transition metal (M) at one site (the anionic site, Y) and is bonded either (i) with a coordinate bond to the transition metal at one other site (bidentate) or (ii) with a plurality of coordinate bonds at several other sites (tridentate, tetradentate, etc.). Such coordinate bonding can take place, for example, via the D heteroatom or Ar group(s). Examples of tridentate monoanionic ligands include, without limitation, $Y-R_t-DR'_{n-1}-R_t-DR'_n$ and $Y(-R-DR'_n)_2$. It is noted, however, that heteroatom(s) or aryl substituent(s) can be present on the Y group without coordinately bonding to the reduced transition metal M, so long as at least one coordinate bond is formed between an electron-donating group D or an electron donating Ar group and the reduced transition metal M.

R represents a connecting or bridging group between the DR'_n and Y, and/or between the electron-donating aryl (Ar) group and Y. Since R is optional, "t" can be zero. The R-group is discussed below in paragraph (d) in more detail.

(c) The Y Group

The Y group of the multidentate monoanionic ligand (X) is preferably a cyclopentadienyl, amido (-NR'-), or phosphido (-PR'-) group.

5 Most preferably, the Y group is a cyclopentadienyl ligand (Cp group). As referred to herein, the term cyclopentadienyl group encompasses substituted cyclopentadienyl groups such as indenyl, fluorenyl, and benzoindenyl groups, and other
 10 polycyclic aromatics containing at least one 5-member dienyl ring, so long as at least one of the substituents of the Cp group is an $R_t-DR'_n$ group or R_t-Ar group that replaces one of the hydrogens bonded to the five-member ring of the Cp group via an
 15 exocyclic substitution.

Examples of a multidentate monoanionic ligand with a Cp group as the Y group (or ligand) include the following (with the (- $R_t-DR'_n$) or ($Ar-R_t-$) substituent on the ring):

20

The Y group can also be a hetero
 cyclopentadienyl group. As referred to herein, a hetero
 35 cyclopentadienyl group means a hetero ligand derived from a cyclopentadienyl group, but in which at least one of the atoms defining the five-member ring structure of the cyclopentadienyl is replaced with a hetero atom via an endocyclic substitution. The hetero
 40 Cp group also includes at least one $R_t-DR'_n$ group or

R_t -Ar group that replaces one of the hydrogens bonded to the five-member ring of the Cp group via an exocyclic substitution. As with the Cp group, as referred to herein the hetero Cp group encompasses
 5 indenyl, fluorenyl, and benzoindenyl groups, and other polycyclic aromatics containing at least one 5-member dienyl ring, so long as at least one of the substituents of the hetero Cp group is an R_t -DR'_n group or R_t -Ar group that replaces one of the hydrogens
 10 bonded to the five-member ring of the hetero Cp group via an exocyclic substitution.

The hetero atom can be selected from group 14, 15 or 16 of the Periodic Table of Elements. If there is more than one hetero atom present in the five-
 15 member ring, these hetero atoms can be either the same or different from each other. More preferably, the hetero atom(s) is/are selected from group 15, and still more preferably the hetero atom(s) selected is/are phosphorus.

20 By way of illustration and without limitation, representative hetero ligands of the X group that can be practiced in accordance with the present invention are hetero cyclopentadienyl groups having the following structures, in which the hetero
 25 cyclopentadienyl contains one phosphorus atom (i.e., the hetero atom) substituted in the five-member ring:

It is noted that, generally, the transition metal group M is bonded to the Cp group via an η^5 bond.
 40

The other R' exocyclic substituents (shown in formula (III)) on the ring of the hetero Cp group can be of the same type as those present on the Cp group, as represented in formula (II). As in formula (II), at least one of the exocyclic substituents on the five-member ring of the hetero cyclopentadienyl group of formula (III) is the $R_t-DR'_n$ group or the R_t-Ar group.

The numeration of the substitution sites of the indenyl group is in general and in the present description based on the IUPAC Nomenclature of Organic Chemistry 1979, rule A 21.1. The numeration of the substituent sites for indene is shown below. This numeration is analogous for an indenyl group:

The Y group can also be an amido ($-NR'-$) group or a phosphido ($-PR'-$) group. In these alternative embodiments, the Y group contains nitrogen (N) or phosphorus (P) and is bonded covalently to the transition metal M as well as to the (optional) R group of the ($-R_t-DR'_n$) or ($Ar-R_t-$) substituent.

(d) The R Group

The R group is optional, such that it can be absent from the X group. Where the R group is absent, the DR'_n or Ar group is bonded directly to the Y group (that is, the DR'_n or Ar group is bonded directly to the Cp, amido, or phosphido group). The presence or absence of an R group between each of the DR'_n groups and/or Ar groups is independent.

Where at least one of the R groups is present, each of the R group constitutes the connecting bond between, on the one hand the Y group, and on the other hand the DR'_n group or the Ar group. The presence and size of the R group determines the accessibility of

the transition metal M relative to the DR'_n or Ar group, which gives the desired intramolecular coordination. If the R group (or bridge) is too short or absent, the donor may not coordinate well due to ring tension. The R groups are each selected independently, and can generally be, for example, a hydrocarbon group with 1-20 carbon atoms (e.g., alkylidene, arylidene, aryl alkylidene, etc.). Specific examples of such R groups include, without limitation, methylene, ethylene, propylene, butylene, phenylene, whether or not with a substituted side chain. Preferably, the R group has the following structure:

(IV)

where $p = 1-4$. The R' groups of formula (IV) can each be selected independently, and can be the same as the R' groups defined below in paragraph (g).

In addition to carbon, the main chain of the R group can also contain silicon or germanium. Examples of such R groups are: dialkyl silylene ($-SiR'_2-$), dialkyl germylene ($-GeR'_2-$), tetra-alkyl silylene ($-SiR'_2-SiR'_2-$), or tetraalkyl silaethylene ($-SiR'_2CR'_2-$). The alkyl groups in such a group preferably have 1-4 carbon atoms and more preferably are a methyl or ethyl group.

(e) The DR'_n Group

This donor group consists of an electron-donating hetero atom D, selected from group 15 or 16 of the Periodic Table of Elements, and one or more substituents R' bonded to D. The number (n) of R' groups is determined by the nature of the hetero atom D, insofar as n being 2 if D is selected from group 15 and n being 1 if D is selected from group 16. The R' substituents bonded to D can each be selected

independently, and can be the same as the R' groups defined below in paragraph (g), with the exception that the R' substituent bonded to D cannot be hydrogen.

The hetero atom D is preferably selected from the group consisting of nitrogen (N), oxygen (O), phosphorus (P) and sulphur (S); more preferably, the hetero atom is nitrogen (N). Preferably, the R' group is an alkyl, more preferably an n-alkyl group having 1-20 carbon atoms, and most preferably an n-alkyl having 1-8 carbon atoms. It is further possible for two R' groups in the DR'_n group to be connected with each other to form a ring-shaped structure (so that the DR'_n group can be, for example, a pyrrolidinyl group). The DR'_n group can form coordinate bonds with the transition metal M.

(f) The Ar Group

The electron-donating group (or donor) selected can also be an aryl group (C₆R'₅), such as phenyl, tolyl, xylyl, mesityl, cumenyl, tetramethyl phenyl, pentamethyl phenyl, a polycyclic group such as triphenylmethane, etc. The electron-donating group D of formula (I) cannot, however, be a substituted Cp group, such as an indenyl, benzoindenyl, or fluorenyl group.

The coordination of this Ar group in relation to the transition metal M can vary from η^1 to η^6 .

(g) The R' Group

The R' groups may each separately be hydrogen or a hydrocarbon radical with 1-20 carbon atoms (e.g. alkyl, aryl, aryl alkyl and the like as shown in Table 1).

Examples of alkyl groups are methyl, ethyl, propyl, butyl, hexyl and decyl. Examples of aryl groups are phenyl, mesityl, tolyl and cumenyl. Examples of aryl alkyl groups are benzyl, pentamethylbenzyl, xylyl,

styryl and trityl. Examples of other R' groups are halides, such as chloride, bromide, fluoride and iodide, m thoxy, ethoxy and phenoxy.

Also, two adjacent hydrocarbon radicals of the Y group
5 can be connected with each other to define a ring system; therefore the Y group can be an indenyl, a fluorenyl or a benzoindenyl group. The indenyl, fluorenyl, and/or benzoindenyl can contain one or more R' groups as substituents. R' can also be a substituent
10 which instead of or in addition to carbon and/or hydrogen can comprise one or more hetero atoms of groups 14-16 of the Periodic Table of Elements. Thus, a substituent can be, for example, a Si-containing group, such as Si(CH₃)₃.

15

(h) The L Group

The transition metal complex contains two monoanionic ligands L bonded to the transition metal M. Examples of the L group ligands, which can be identical
20 or different, include, without limitation, the following: a hydrogen atom; a halogen atom; an alkyl, aryl or aryl alkyl group; an alkoxy or aryloxy group; a group comprising a hetero atom selected from group 15 or 16 of the Periodic Table of Elements, including, by
25 way of example, (i) a sulphur compound, such as sulphite, sulphate, thiol, sulphonate, and thioalkyl, and (ii) a phosphorus compound, such as phosphite, and phosphate. The two L groups can also be connected with each other to form a dianionic bidentate ring system.

30

These and other ligands can be tested for
~~their suitability by means of simple experiments by one~~
skilled in the art.

Preferably, L is a halide and/or an alkyl or aryl group; more preferably, L is a Cl group and/or a
35 C₁-C₄ alkyl or a benzyl group. The L group, however, cannot be a Cp, amido, or phosphido group. In other

words, L cannot be on of the Y groups.

(i) The K Ligand

The K ligand is a neutral or anionic group bonded to the transition metal M. The K group is a neutral or anionic ligand bonded to M. When K is a neutral ligand K may be absent, but when K is monoanionic, the following holds for K_m :

- $m = 0$ for M^{3+}
- $m = 1$ for M^{4+}
- $m = 2$ for M^{5+}

On the other hand, neutral K ligands, which by definition are not anionic, are not subject to the same rule. Therefore, for each neutral K ligand, the value of m (i.e., the number of total K ligands) is one higher than the value stated above for a complex having all monoanionic K ligands.

The K ligand can be a ligand as described above for the L group or a Cp group ($-C_5R'_5$), an amido group ($-NR'_2$) or a phosphido group ($-PR'_2$). The K group can also be a neutral ligand such as an ether, an amine, a phosphine, a thioether, among others.

If two K groups are present, the two K groups can be connected with each other via an R group to form a bidentate ring system.

As can also be seen from formula (I), the X group of the complex contains a Y group to which are linked one or more donor groups (the Ar group(s) and/or DR'_n group(s)) via, optionally, an R group. The number of donor groups linked to the Y group is at least one and at most the number of substitution sites present on a Y group.

With reference, by way of example, to the structure according to formula (II), at least one substitution site on a Cp group is made by an R_t -Ar group or by an R_t - DR'_n group (in which case $q + s = 1$).

If all the R' groups in formula (II) were R_t-Ar groups, R_t-DR'_n groups, or any combination thereof, the value of (q + s) would be 5.

One preferred embodiment of the catalyst composition according to the present invention comprises a transition metal complex in which a bidentate/monoanionic ligand is present and in which the reduced transition metal has been selected from group 4 of the Periodic Table of Elements and has an oxidation state of +3.

In this case, the catalyst composition according to the invention comprises a transition metal complex represented by formula (V):

where the symbols have the same meaning as described above for formula (I) and where M(III) is a transition metal selected from group 4 of the Periodic Table of Elements and is in oxidation state 3+.

Such a transition metal complex has no anionic K ligands (for an anionic K, m = 0 in case of M³⁺).

It should be pointed out that in WO-A-93/19104, transition metal complexes are described in which a group 4 transition metal in a reduced oxidation state (3+) is present. The complexes described in WO-A-93/19104 have the general formula:

The Y group in this formula (VI) is a hetero atom, such as phosphorus, oxygen, sulfur, or nitrogen bonded covalently to the transition metal M (see p. 2 of WO-A-

93/19104). This means that the $Cp_2(ZY)_2$ group is of a dianionic nature, and has the anionic charges residing formerly on the Cp and Y groups. Accordingly, the $Cp_2(ZY)_2$ group of formula (VI) contains two covalent bonds: the first being between the 5-member ring of the Cp group and the transition metal M, and the second being between the Y group and the transition metal. By contrast, the X group in the complex according to the present invention is of a monoanionic nature, such that a covalent bond is present between the Y group (e.g., the Cp group) and transition metal, and a coordinate bond can be present between the transition metal M and one or more of the $(Ar-R_t-)$ and $(-R_t-DR'_n)$ groups. This changes the nature of the transition metal complex and consequently the nature of the catalyst that is active in the polymerization. As referred to herein, a coordinate bond is a bond (e.g., H_3N-BH_3) which when broken, yields either (i) two species without net charge and without unpaired electrons (e.g., $H_3N:$ and BH_3) or (ii) two species with net charge and with unpaired electrons (e.g., $H_3N^{\cdot\cdot}$ and $BH_3^{\cdot-}$). On the other hand, as referred to herein, a covalent bond is a bond (e.g., CH_3-CH_3) which when broken yields either (i) two species without net charge and with unpaired electrons (e.g., CH_3^{\cdot} and CH_3^{\cdot}) or (ii) two species with net charges and without unpaired electrons (e.g., CH_3^+ and CH_3^-). A discussion of coordinate and covalent bonding is set forth in Haaland et al. (Angew. Chem Int. Ed. Eng. Vol. 28, 1989, p. 992), the complete disclosure of which is incorporated herein by reference.

The following explanation is proposed, although it is noted that the present invention is in no way limited to this theory.

Referring now more particularly to FIG. 2, the transition metal complexes described in WO-A-93/19104 are ionic after interaction with the co-

catalyst. However, the transition metal complex according to WO-A-93/19104 that is active in the polymerization contains an overall neutral charge (on the basis of the assumption that the polymerizing transition metal complex comprises, a M(III) transition metal, one dianionic ligand and one growing monoanionic polymer chain (POL)). By contrast, as shown in FIG. 1, the polymerization active transition metal complex of the catalyst composition according to the present invention is of a cationic nature (on the basis of the assumption that the polymerizing transition metal complex - based on the formula (V) structure - comprises, a M(III) transition metal, one monoanionic bidentate ligand and one growing monoanionic polymer chain (POL)).

Transition metal complexes in which the transition metal is in a reduced oxidation state, but have the following structure:

are generally not active in co-polymerization reactions. It is precisely the presence, in the transition metal complex of the present invention, of the DR' or Ar group (the donor), optionally bonded to the Y group by means of the R group, that gives a stable transition metal complex suitable for polymerization.

Such an intramolecular donor is to be preferred over an external (intermolecular) donor on account of the fact that the former shows a stronger and more stable coordination with the transition metal complex.

It will be appreciated that the catalyst system may also be formed in situ if the components thereof are added directly to the polymerization

reactor system and a solvent or diluent, including liquid monomer, is used in said polymerization reactor.

The catalyst composition of the present invention also contains a co-catalyst. For example, the co-catalyst can be an organometallic compound. The metal of the organometallic compound can be selected from group 1, 2, 12 or 13 of the Periodic Table of Elements. Suitable metals include, for example and without limitation, sodium, lithium, zinc, magnesium, and aluminum, with aluminum being preferred. At least one hydrocarbon radical is bonded directly to the metal to provide a carbon-metal bond. The hydrocarbon group used in such compounds preferably contains 1-30, more preferably 1-10 carbon atoms. Examples of suitable compounds include, without limitation, amyl sodium, butyl lithium, diethyl zinc, butyl magnesium chloride, and dibutyl magnesium. Preference is given to organoaluminium compounds, including, for example and without limitation, the following: trialkyl aluminum compounds, such as triethyl aluminum and tri-isobutyl aluminum; alkyl aluminum hydrides, such as di-isobutyl aluminum hydride; alkylalkoxy organoaluminium compounds; and halogen-containing organoaluminium compounds, such as diethyl aluminum chloride, diisobutyl aluminum chloride, and ethyl aluminum sesquichloride. Preferably, linear or cyclic aluminoxanes are selected as the organoaluminium compound.

In addition or as an alternative to the organometallic compounds as the co-catalyst, the catalyst composition of the present invention can include a compound which contains or yields in a reaction with the transition metal complex of the present invention a non-coordinating or poorly coordinating anion. Such compounds have been described for instance in EP-A-426,637, the complete disclosure

- of which is incorporated herein by reference. Such an anion is bonded sufficiently unstably such that it is replaced by an unsaturated monomer during the copolymerization. Such compounds are also mentioned in
- 5 EP-A-277,003 and EP-A-277,004, the complete disclosures of which are incorporated herein by reference. Such a compound preferably contains a triaryl borane or a tetraaryl borate or an aluminum equivalent thereof. Examples of suitable co-catalyst compounds include,
- 10 without limitation, the following:
- dimethyl anilinium tetrakis (pentafluorophenyl) borate $[\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2\text{H}]^+ [\text{B}(\text{C}_6\text{F}_5)_4]^-$;
 - dimethyl anilinium bis (7,8-dicarbaundecaborate)-cobaltate (III);
 - 15 - tri(n-butyl)ammonium tetraphenyl borate;
 - triphenylcarbenium tetrakis (pentafluorophenyl) borate;
 - dimethylanilinium tetraphenyl borate;
 - tris(pentafluorophenyl) borane; and
 - 20 - tetrakis(pentafluorophenyl) borate.

If the above-mentioned non-coordinating or poorly coordinating anion is used, it is preferable for the transition metal complex to be alkylated (that is, the L group is an alkyl group). As described for

25 instance in EP-A-500,944, the complete disclosure of which is incorporated herein by reference, the reaction product of a halogenated transition metal complex and an organometallic compound, such as for instance triethyl aluminum (TEA), can also be used.

30 The molar ratio of the co-catalyst relative to the transition metal complex, in case an organometallic compound is selected as the co-catalyst, usually is in a range of from about 1:1 to about 10,000:1, and preferably is in a range of from about

35 1:1 to about 2,500:1. If a compound containing or yielding a non-coordinating or poorly coordinating

anion is selected as co-catalyst, the molar ratio usually is in a range of from about 1:100 to about 1,000:1, and preferably is in a range of from about 1:2 to about 250:1.

5 As a person skilled in the art would be aware, the transition metal complex as well as the co-catalyst can be present in the catalyst composition as a single component or as a mixture of several components. For instance, a mixture may be desired
10 where there is a need to influence the molecular properties of the polymer, such as molecular weight and in particular molecular weight distribution.

The process according to the invention is suitable for the preparation of semi-crystalline or of
15 amorphous copolymers based on ethylene and an α -olefin.

Besides the ethylene, the copolymer according to the invention comprises one or more α -olefins. In general, such an α -olefin contains 3-25 carbon atoms (although higher α -olefins are also allowable); more
20 preferably, the α -olefin contains 3-10 carbon atoms. The α -olefin has preferably been selected from the group consisting of propylene, butene, isobutene, pentene, 4-methyl pentene, hexene, octene and (α -methyl) styrene. More preferably, the α -olefin is
25 propylene, 1-butene, 1-hexene or 1-octene. Most preferred, the α -olefin is propylene.

As indicated before, the process of the present invention enables the preparation of an ethylene/ α -olefin copolymer with a broad range of
30 molecular weights M_n . An alternative for products with ~~a high-molecular-weight-is-the-characterisation-of-the~~ copolymer by its Mooney viscosity (ML_{1+1} , 125°C, as per ASTM D1646). The process of the present invention is able to prepare ethylene/ α -olefin copolymers having an
35 ML_{1+1} , 125°C of between 10 and 150.

The catalyst composition in the process

according to the invention can be used supported or non-supported. The transition metal complex or the co-catalyst can be supported on a carrier. It is also possible that both the transition metal complex and the co-catalyst are supported on a carrier. The carrier material for the transition metal complex and for the co-catalyst can be the same material or a different material. It is also possible to support the transition metal complex and the co-catalyst on the same carrier. The supported catalyst systems of the invention can be prepared as separate compounds, which can be used as such in polymerization reactions or the supported catalyst systems can be formed in situ by in situ methods just before a polymerization reaction starts. The supported catalysts are used mainly in gas phase and slurry processes. The carrier used may be any carrier known as carrier material for catalysts, for instance, finely divided solid porous support, including, but not limited to, or MgCl_2 , Zeolites, mineral clays, inorganic oxides such as talc, silica (SiO_2), alumina (Al_2O_3), silica-alumina, inorganic hydroxides, phosphates, sulphates, and the like, or resinous support materials such as polyolefins, including polystyrene, or mixtures thereof.

The carrier may be used as such, or be modified, for example by silanes, aluminium alkyls, aluminoxanes, and others. The catalyst composition may also be prepared by in-situ methods.

Polymerization can be effected in a known manner, in the gas phase as well as in a liquid reaction medium. In the latter case, both solution and suspension polymerization are suitable, while the quantity of transition metal to be used generally is such that its concentration in the dispersion agent amounts to 10^{-8} - 10^{-3} mol/l, preferably 10^{-7} - 10^{-4} mol/l.

Any liquid that is inert relative to the catalyst system can be used as a dispersion agent in the polymerization. One or more saturated, straight or branched aliphatic hydrocarbons, such as butanes, pentanes, hexanes, heptanes, pentamethyl heptane or mineral oil fractions such as light or regular petrol, naphtha, kerosine or gas oil are suitable for that purpose. Aromatic hydrocarbons, for instance benzene and toluene, can be used, but because of their cost as well as on account of safety considerations, it will be preferred not to use such solvents for production on a technical scale. In polymerization processes, on a technical scale, it is preferred, therefore, to use as a solvent the low-priced aliphatic hydrocarbons or mixtures thereof, as marketed by the petrochemical industry. If an aliphatic hydrocarbon is used as solvent, the solvent may yet contain minor quantities of aromatic hydrocarbon, for instance toluene. Thus, if for instance methyl aluminoxane (MAO) is used as co-catalyst, toluene can be used as solvent in order to supply the MAO in dissolved form to the polymerization reactor. Drying or purification is desirable if such solvents are used; this can be done without problems by the average person skilled in the art.

If the polymerization is carried out under pressure, the yield of polymer can be increased additionally, resulting in an even lower catalyst residue content. Chain regulators can be used to control the molecular weight and the amount of unsaturation of the resulting copolymer. Preference is given to hydrogen as the chain regulator.

The polymerization can also be performed in several steps, in series as well as in parallel. If required, the catalyst composition, temperature, hydrogen concentration, pressure, residence time, etc. may be varied from step to step. In this way it is also

possible to obtain products with a wide molecular weight distribution.

The polymer solution resulting from the polymerization can be worked up by a method known per se. In general the catalyst is de-activated at some point during the processing of the polymer. The de-activation is also effected in a manner known per se, e.g. by means of water or an alcohol. Removal of the catalyst residues can mostly be omitted because the quantity of catalyst in the polymer, in particular the content of halogen and transition metal is very low at this point owing to the use of the catalyst system in the process according to the invention.

The copolymers, prepared according to the process of the present invention, can be used in different applications, like impact modifications, use in extrusion coating and wire-and-cable applications. These polymers are also useful in the manufacture of rubber articles and modified rubber articles.

The invention will now be elucidated by means of the following non-restrictive examples.

In the following: "Cp" means "cyclopentadienyl"; "Me" means "methyl"; "Bu" means "butyl"; "iPr" means "isopropyl".

EXAMPLES

Synthesis of bidentate monocyclopentadienyl complexes

Example I

Synthesis of (dimethylaminoethyl)tetramethylcyclopentadienyltitanium(III)dichloride ($\text{CpMe}_4(\text{CH}_2)_2\text{NMe}_2\text{TiCl}_2$).

a) Preparation of 4-hydroxy-4-(dimethylamino-ethyl)-3,5-dimethyl-2,5-heptadiene

(7. 2-bromo-2-butene (108 g; 0.800 mol) was added

to 10.0 g of lithium (1.43 mol) in diethyl ether (300 mL) in about 30 minutes with reflux. After stirring overnight (17 hours), ethyl-3-(N,N-dimethylamino)propionate (52.0 g; 0.359 mol) was added to the reaction mixture in about 15 minutes. After stirring for 30 minutes at room temperature 200 mL of water was added dropwise. After separation, the water phase was extracted two times with 50 mL of CH_2Cl_2 . The organic phase was boiled down and the residue was distilled at reduced pressure. The yield was 51.0 g (67%).

15 b) Preparation of (dimethylaminoethyl)tetramethyl-
cyclopentadiene

The carbinol (21.1 g; 0.10 mol) prepared as described under a) was added in a single portion to p-toluenesulphonic acid. H_2O (28.5 g; 0.15 mol), dissolved in 200 mL of diethyl ether. After stirring for 30 minutes at room temperature, the reaction mixture was poured out in a solution of 50 g of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ in 250 mL of water. After separation, the water phase was extracted two times with 100 mL of diethyl ether. The combined ether layer was dried (Na_2SO_4), filtered and 25 boiled down. Then the residue was distilled at reduced pressure. The yield was 11.6 g (60%).

c) Preparation of (dimethylaminoethyl)tetramethyl-
cyclopentadienyltitanium(III)dichloride

30 1.0 equivalent of n-BuLi (1.43 mL; 1.6 M) was added (after cooling to -60°C) to a solution of the $\text{C}_5\text{Me}_4\text{H}(\text{CH}_2)_2\text{NMe}_2$ of b) (0.442 g; 2.29 mmol) in THF (50 mL), after which the cooling bath was removed. After warming to room temperature, the solution was cooled to 35 -100°C and then $\text{TiCl}_3 \cdot 3\text{THF}$ (0.85 g; 2.3 mmol) was added in a single portion. After stirring for 2 hours at room

temperature, the THF was removed at reduced pressure. After addition of special boiling point gasoline, the complex (a green solid) was purified by repeated washing of the solid, followed by filtration and back distillation of the solvent. It was also possible to obtain the pure complex through sublimation.

Example II

Synthesis of (dibutylaminoethyl)tetramethylcyclopentadienyltitanium(III) dichloride
($\text{CpMe}_4(\text{CH}_2)_4\text{NBu}_2\text{TiCl}_2$).

a) Preparation of ethyl 3-(N,N-di-n-butylamino)propionate

Ethyl 3-bromopropionate (18.0 g; 0.10 mol) was added carefully to di-n-butylamine (25.8 g; 0.20 mol), followed by stirring for 2 hours. Then diethyl ether (200 mL) and pentane (200 mL) were added. The precipitate was filtered off, the filtrate was boiled down and the residue was distilled at reduced pressure. The yield was 7.0 g (31%).

b) Preparation of bis(2-butenyl)(di-n-butylaminoethyl)-methanol

2-Lithium-2-butene was prepared from 2-bromo-2-butene (16.5 g; 0.122 mol) and lithium (2.8 g; 0.4 mol) as in Example I. To this, the ester of a) (7.0 g; 0.031 mol) was added with reflux in approx. 5 minutes, followed by stirring for about 30 minutes. Then water (200 mL) was carefully added dropwise. The water layer was separated off and extracted twice with 50 mL of CH_2Cl_2 . The combined organic layer was washed once with 50 mL of water, dried (K_2CO_3), filtered and boiled down. The yield was 9.0 g (100%).

c) Preparation of (di-n-butylaminoethyl)tetramethyl-

cyclopentadiene)

4.5 g (0.015 mol) of the carbinol of b) was added dropwise to 40 mL of concentrated sulphuric acid of 0°C, followed by stirring for another 30 minutes at 0°C. Then the reaction mixture was poured out in a mixture of 400 mL of water and 200 mL of hexane. The mixture was made alkaline with NaOH (60 g) while being cooled in an ice bath. The water layer was separated off and extracted with hexane. The combined hexane layer was dried (K_2CO_3), filtered and boiled down. The residue was distilled at reduced pressure. Boiling point 110°C (0.1 mm Hg). The yield was 2.3 g (55%).

d) Preparation of (di-n-

butylaminoethyl)tetramethylcyclopentadienyltitanium(III)dichloride

1.0 equivalent of n-BuLi (0.75 mL; 1.6 M) was added (after cooling to -60°C) to a solution of the $C_3Me_4H(CH_2)_2NBu_2$ of c) (0.332 g; 1.20 mmol) in THF (50 mL), after which the cooling bath was removed. After warming to room temperature, the solution was cooled to -100°C and then $TiCl_3 \cdot 3THF$ (0.45 g; 1.20 mmol) was added in a single portion. After stirring for 2 hours at room temperature, the THF was removed at reduced pressure. The purification was done as in Example I.

Example III

The catalyst is (dimethylaminomethyl)-diisopropyl-cyclopentadienyltitanium-(III) dichloride ($CpH_2^iPr_2(CH_2)_2NMe_2TiCl_2$).

a. Preparation of di(2-propyl)cyclopentadiene

In a double-walled reactor having a volume of 200 mL, provided with baffles, condenser, top stirrer, thermometer and dropping funnel, 180 g of clear 50% strength NaOH (2.25 mol), 9.5 g of Aliquat 336 (23

mmol) and 15 g (0.227 mol) of freshly cracked cyclopentadiene were combined. The reaction mixture was stirred turbulently at a speed of 1385 rpm for a few minutes. Then 56 g of 2-propyl bromide (0.46 mol) were
5 added, cooling with water taking place at the same time. A few minutes after the addition of the 2-propyl bromide the temperature rose by approximately 10°C. Stirring then continued for 6 hours at 50°C. GC was used to show that at that instant 92% of di(2-
10 propyl)cyclopentadiene was present in the mixture of di- and tri(2-propyl)cyclopentadiene. The product was distilled at 10 mbar and 70°C. After distillation, 25.35 g of di(2-propyl)cyclopentadiene were obtained. Characterization took place with the aid of GC, GC-MS,
15 ¹³C- and ¹H-NMR.

b. Preparation of (dimethylaminoethyl)tri(2-propyl)-cyclopentadiene

In a dry 500 mL three-necked flask with a
20 magnetic stirrer, a solution of 62.5 mL of *n*-butyllithium (1.6M in *n*-hexane; 100 mmol) was added under a dry nitrogen atmosphere to a solution of 19.2 g (100 mmol) of triisopropyl-cyclopentadiene in 250 mL of THF at -60°C. After heating to room temperature (in
25 approximately 1 hour) stirring continued for a further 2 hours. After cooling to -60°C, a solution of (dimethylaminoethyl) tosylate (105 mmol) prepared in situ was added over a period of 5 minutes. The reaction mixture was heated to room temperature, followed by
30 overnight stirring. After addition of water, the product was extracted with petroleum ether (40-60°C).
The combined organic layer was dried (Na₂SO₄) and evaporated under reduced pressure.
The conversion was 97%. The dimethylamino-
35 ethyldiisopropylcyclopentadiene was obtained by distillation, with a yield of 54%.

c. Synthesis of [1-(dimethylaminoethyl)-2,4-di(2-propyl)cyclopentadienyltitanium(III) dichloride
 $[C_5H_2(iPr)_2(CH_2)_2NMe_2Ti(III)Cl_2]$

- To 8.9 g (40.3 mmol) of (dimethylaminoethyl)-
- 5 di-(2-propyl)cyclopentadiene in 100 mL of tetrahydrofuran in a 250 mL 3-necked flask, 25.2 mL of n-butyllithium (1.6M, 40.3 mmol) were added dropwise. In a second (500 mL) 3-necked flask, 100 ml of tetrahydrofuran were added to 14.93 g (40.3 mmol) of
- 10 $Ti(III)Cl_3 \cdot 3THF$. Both flasks were cooled to $-60^\circ C$ and the organolithium compound was then added to the $Ti(III)Cl_3$ suspension. The reaction mixture containing 1-(dimethylaminoethyl)-2,4-di(2-propyl)cyclopentadienyltitanium(III) dichloride was
- 15 slowly brought to room temperature, after which stirring was continued for a further 18 hours.

Polymerisations

- The catalysts given in Examples I, II and III
- 20 were methylated with MeLi in diethylether.

- A number of continuous streams of petrol, propylene, ethylene catalyst and co-catalyst were dosed to a 1-litre reactor. The solution was continuously removed from the reactor. The catalyst was inactivated
- 25 with the aid of isopropyl alcohol in a flash vessel; the monomers were flashed and the solution was stabilised with the aid of about 1000 ppm of Irganox 1076®. The polymer was analysed after further processing.
- 30

Analysis of the polymers

- The composition of the polymers was determined with the aid of Fourier Transform Infrared Spectroscopy (FT-IR). The FT-IR results indicate the
- 35 composition of the various monomers in weight percentages relative to the overall composition.

Th polymers prepared according to the Examples were analysed by means of SEC-DV. Molecular weight distributions were determined according to the universal calibration principle as known from literature (see Z. Grubistic, R. Rempp, H. Benoit, J. Polym. Sci., part B, 5, 753 (1967)).

The intrinsic viscosity (IV) was determined in decaline at 135°C.

- 10 The catalysts given in Examples I, II and III were methylated with MeLi in diethylether.

The catalyst was inactivated with the aid of isopropyl alcohol in a flash vessel; the monomers were flashed and the solution was stabilised with the aid of about 1000 ppm of Irganox 1076®. The polymer was analysed after further processing.

Analysis of the polymers

- The composition of the polymers was determined with the aid of Fourier Transform Infrared Spectroscopy (FT-IR). The FT-IR results indicate the composition of the various monomers in weight percentages relative to the overall composition.

- The polymers prepared according to the Examples were analysed by means of SEC-DV. Molecular weight distributions were determined according to the universal calibration principle as described in Z. Grubistic, R. Rempp, H. Benoit, J. Polym. Sci., part B, 5, 753 (1967), the complete disclosure of which is incorporated herein by reference.

The intrinsic viscosity (int.visc. or "IV"

was determined in decaline at 135°C.

Examples IV-VIII

Table 1 presents the polymerization
5 conditions of the continuous polymerization of ethylene
and propylene for Examples IV-VIII. This Table
indicates: the amounts of petrol, propylene and
ethylene, the amount of catalyst added, the amount of
co-catalyst, the polymerization temperature and the
10 polymerization time.
Different catalysts have been used in the Examples:
catalyst a is $(\text{Cp}(\text{Me})_4(\text{CH}_2)_2\text{NMe}_2)\text{TiMe}_2$,
catalyst b is $(\text{Cp}(\text{Me})_4(\text{CH}_2)_2\text{NBu}_2)\text{TiMe}_2$, and
catalyst c is $(\text{CpH}_2^1\text{Pr}(\text{CH}_2)_2\text{NMe}_2)\text{TiMe}_2$
15 (as they are prepared according to Examples I-III). The
co-catalyst used in the Examples is dimethylanilinium
tetrakis(pentafluorophenyl)borate $[\text{HMe}_2\text{N}-\text{C}_6\text{H}_5]^+[(\text{C}_6\text{F}_5)_4\text{B}]^-$

The results of the continuous polymerizations
20 according to Examples IV-VIII are summarized in Table
2. This Table indicates: the polymer production (yield,
expressed in grams/hour), the catalyst activity
(expressed in kgram polymer/gram transition metal), the
composition of the polymer determined with the aid of
25 FT-IR (expressed in weight percentages), the intrinsic
viscosity of the copolymer, the number average
molecular weight (M_n), the weight average molecular
weight (M_w) and the absolute molecular weight
distribution ($\text{MWD} = M_w/M_n$), determined with the aid of
30 SEC-DV.

~~Some examples of transition metal complexes~~
useful in the process according to the invention are
presented in Table 3.

WHAT IS CLAIMED IS:

1. A process for the preparation of an ethylene/ α -olefin copolymer with an ethylene content of between 20 and 90 weight %, by the step of conducting polymerization of ethylene and at least one α -olefin under effective copolymerization conditions at a temperature of between about 100°C and about 220°C, in the presence of a catalyst comprising a reduced transition metal complex and a co-catalyst, wherein said reduced transition metal complex has the following structure:

wherein:

- M is a reduced transition metal selected from group 4, 5 or 6 of the Periodic Table of the Elements;
- X is a multidentate monoanionic ligand represented by the formula $(Ar-R_t-)_p Y(-R_t-DR'_n)_q$;
- Y is a member selected from the group consisting of a cyclopentadienyl, amido $(-NR'-)$, and phosphido $(-PR'-)$ group;
- R is at least one member selected from the group consisting of (i) a connecting group between the Y group and the DR'_n group and (ii) a connecting group between the Y group and the Ar group, wherein when the ligand X contains more than one R group, the R groups can be identical as or different from each other;

- D is an electron-donating hetero atom selected from group 15 or 16 of the Periodic Table of Elements;
- R' is a substituent selected from the group consisting of a hydrogen, hydrocarbon radical and hetero atom-containing moiety, except that R' cannot be hydrogen when R' is directly bonded to the electron-donating hetero atom D, wherein when the multidentate monoanionic ligand X contains more than one substituent R', the substituents R' can be identical or different from each other;
- Ar is an electron-donating aryl group;
- L is a monoanionic ligand bonded to the reduced transition metal M, wherein the monoanionic ligand L is not a ligand comprising a cyclopentadienyl, amido ($-NR'^{-}$), or phosphido ($-PR'^{-}$) group, and wherein the monoanionic ligands L can be identical or different from each other;
- K is a neutral or anionic ligand bonded to the reduced transition metal M, wherein when the transition metal complex contains more than one ligand K, the ligands K can be identical or different from each other;
- m is the number of K ligands, wherein when the K ligand is an anionic ligand m is 0 for M^{3+} , m is 1 for M^{4+} , and m is 2 for M^{5+} , and when K is a neutral ligand m increases by one for each neutral K ligand;
-
- n is the number of the R' groups bonded to the electron-donating hetero atom D, wherein when D is selected from group 15 of the Periodic Table of Elements n is 2, and when D is selected from group 16 of the Periodic Table of Elements n is 1;

q and s are the number of $(-R_t-DR'_n)$ groups and $(Ar-R_t-)$ groups bonded to group Y, respectively, wherein $q + s$ is an integer not less than 1; and

t is the number of R groups connecting each of (i) the Y and Ar groups and (ii) the Y and DR'_n groups, wherein t is selected independently as 0 or 1.

2. A process according to claim 1, wherein the Y group is a cyclopentadienyl group.
3. A process according to claim 2, wherein the cyclopentadienyl group is an unsubstituted or substituted indenyl, benzoindenyl, or fluorenyl group.
4. A process according to claim 2, wherein said reduced transition metal complex has the following structure:

wherein:

M(III) is a transition metal from group 4 of the Periodic Table of the Elements in oxidation state 3+.

5. A process according to claim 2, wherein said reduced transition metal is titanium.
6. A process according to claim 2, wherein said electron-donating hetero atom D is nitrogen.
7. A process according to claim 2, wherein the R' group in the DR'_n group is an n-alkyl group.
8. A process according to claim 2, wherein said R group has the following structure:

wherein p is 1, 2, 3, or 4.

9. A process according to claim 2, wherein said monoanionic ligand L is selected from the group consisting of a halide, an alkyl group, and a benzyl group.
10. A process according to claim 2, wherein the Y group is a di-, tri- or tetraalkyl-cyclopentadienyl.
11. A process according to claim 2, wherein said co-catalyst comprises a linear or cyclic aluminoxane or a triaryl borane or tetraaryl borate.
12. A process according to claim 2, wherein at least one member selected from the group consisting of said reduced transition metal complex and said co-catalyst is supported on at least one carrier.
13. The process according to claim 1, wherein a copolymer with a number average molecular weight M_n of between 100 and 1,000,000 is prepared.
14. The process according to claim 1, wherein a copolymer with a number average molecular weight M_n of between 100 and 30,000 is prepared.
15. The process according to claim 3, wherein said copolymer is prepared at a temperature of between 135 and 220°C.
16. The process according to claim 1, wherein a copolymer with a number average molecular weight M_n of between 20,000 and 100,000 is prepared.
17. The process according to claim 16, wherein said ~~copolymer is prepared at a temperature of between~~ 115 and 180°C.
18. The process according to claim 1, wherein the polymerization is conducted at a pressure of below 100 MPa.
19. The process according to claim 1, wherein the α -

olefin is a member selected from the group consisting of propylene, 1-butene, 1-hexene, 1-octene, and any combinations thereof.

20. The process according to claim 21, wherein the olefin is propylene.

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 COBF

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
P,X	WO 96 13529 A (DSM NV) 9 May 1996 * claims; page 13, line 33 to page 14, line 4; page 15, lines 25-28; page 16, lines 4-15 *	1-20
A	EP 0 416 815 A (DOW CHEMICAL CO) 13 March 1991 * claims 6-24, 26-28; page 11, lines 32-38; page 17, example 4 *	1-20
A	WO 93 08221 A (DOW CHEMICAL CO) 29 April 1993 * claims; page 31, line 4 to page 32, line 8; examples *	1-20
A	WO 93 19104 A (DOW CHEMICAL CO) 30 September 1993 * claims; page 12, line 27; examples *	1-20

☐ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubt on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition, or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"A" document member of the same patent family

Date of the actual completion of the international search

3 June 1997

Date of mailing of the international search report

26.06.97

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2

BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- ☐ **BLACK BORDERS**
- ☐ **IMAGE CUT OFF AT TOP, BOTTOM OR SIDES**
- ☐ **FADED TEXT OR DRAWING**
- ☐ **BLURRED OR ILLEGIBLE TEXT OR DRAWING**
- ☐ **SKEWED/SLANTED IMAGES**
- ☐ **COLOR OR BLACK AND WHITE PHOTOGRAPHS**
- ☐ **GRAY SCALE DOCUMENTS**
- ☒ **LINES OR MARKS ON ORIGINAL DOCUMENT**
- ☐ **REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY**
- ☐ **OTHER:** _____

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.
